

Otsu Algorithm Optimal Global Thresholding

Nobuyuki Otsu

IEEE Trans. on Systems, Man, and Cybernetics, 1979

Speaker: Shih-Shinh Huang

January 27, 2019

Outline

- Introduction
- Class Separability Measure
- Threshold Selection Algorithm

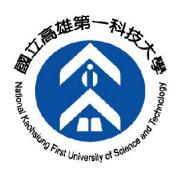

- About Global Thresholding
 - Thresholding: assign a binary value $\in \{0,1\}$ to each image pixel f(x,y) according to threshold t^*

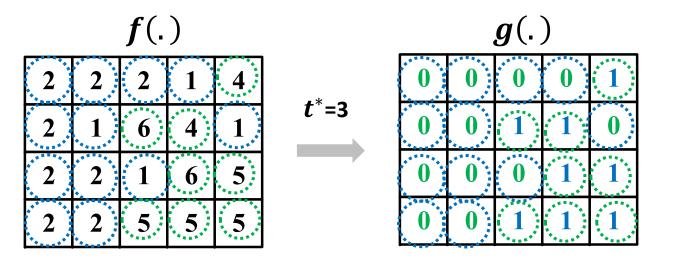

$$g(x,y) = \begin{cases} 0 & if \quad f(x,y) \le t^* \\ 1 & if \quad f(x,y) > t^* \end{cases}$$

• Global Thresholding: t^* is a constant applicable over an entire image.

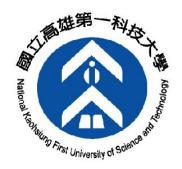

- About Global Thresholding
 - Example: An 5x4 image with 8 gray levels (3 bits)

Global Thresholding → Threshold Selection

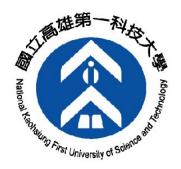

- Formulation (Knowns)
 - let pixels of an image be presented in L gray levels $\{0, 1, ..., L-1\}$
 - define normalized histogram of an image as $\{p_0, p_1, ..., p_{L-1}\}$

$$p_i = n_i/N$$

- n_i : number of pixels at gray level i
- N: total number of pixels

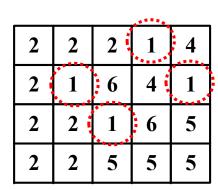

- Formulation (Objective)
 - find an optimal threshold t^* subject to a class separability measure
 - use t^* to dichotomize pixels into two classes
 - $C_0(t^*)$: pixels with levels $\{0,1,...,t^*\}$
 - $C_1(t^*)$: pixels with levels $\{t^* + 1, ..., L 1\}$

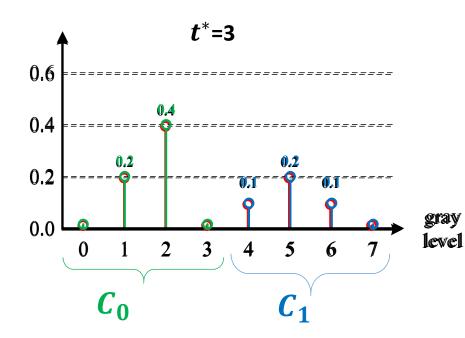

• Formulation

$$N = 20$$

$$p_0 = \frac{0}{20} = 0.0$$

$$p_1 = \frac{4}{20} = 0.2$$

$$p_7 = \frac{0}{20} = 0.0$$

• Statistical Terms: Class Occurrence Probability

$$P_{0}(t) = \sum_{i=0}^{t} p_{i}$$

$$P_{1}(t) = \sum_{i=t+1}^{L-1} p_{i}$$

Statistical Terms

Class Mean

Class Variance

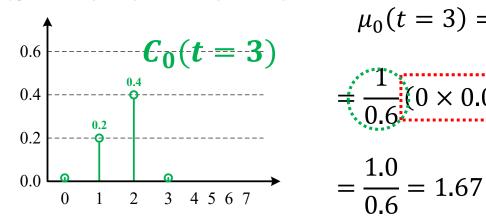

$$\mu_0(t) = \frac{1}{P_0(t)} \sum_{i=0}^{t} i \times p_i \qquad \sigma_0^2(t) = \frac{1}{P_0(t)} \sum_{i=0}^{t} (i - \mu_0(t))^2 \times p_i$$

$$\mu_1(t) = \frac{1}{P_1(t)} \sum_{i=t+1}^{L-1} i \times p_i \qquad \sigma_1^2(t) = \frac{1}{P_1(t)} \sum_{i=t+1}^{L-1} (i - \mu_1(t))^2 \times p_i$$

Statistical Terms

$$\mu_0(t=3) = \frac{1}{0.6} \sum_{i=0}^{3} i \times p_i$$

$$= \frac{1}{0.6} \left(0 \times 0.0 + 1 \times 0.2 + 2 \times 0.4 + 3 \times 0 \right)$$

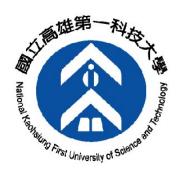

$$=\frac{1.0}{0.6}=1.67$$

$$\sigma_0^2(t=3) = \frac{1}{0.6} \sum_{i=0}^t (i-1.67)^2 \times p_i$$

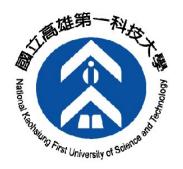

$$= \frac{1}{0.6} \left((0 - 1.67)^2 \times 0.0 + (1 - 1.67)^2 \times 0.2 + (2 - 1.67)^2 \times 0.4 + (3 - 1.67)^2 \times 0 \right)$$

$$=\frac{0.13334}{0.6}=0.22$$

- Observation
 - Pixels in the same class should be with homogeneous intensity.
 - Variance is a good metric for measuring homogeneity.
 - low variance → high homogeneity
 - high variance → low homogeneity
 - Within-Class variance can be applied to evaluate the goodness of a threshold *t*

- Within-Class Variance $\sigma_w^2(t)$
 - Definition:

$$\sigma_w^2(t) = P_0(t)\sigma_0^2(t) + P_1(t)\sigma_1^2(t)$$

• σ_w^2 -Based Objective Function

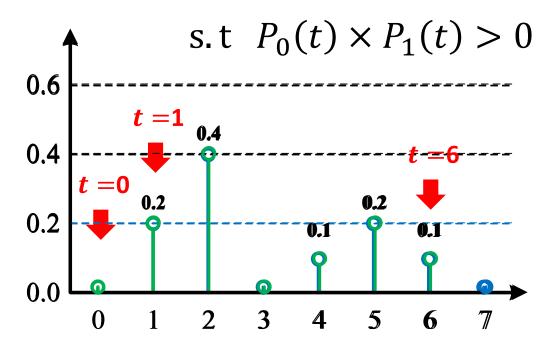

$$t^* = \operatorname{argmin} \sigma_w^2$$
 s.t $P_0(t) \times P_1(t) > 0$

• Within-Class Variance $\sigma_w^2(t)$

$$t^* = \operatorname{argmin} P_0(t)\sigma_0^2(t) + P_1(t)\sigma_1^2(t)$$

t^*	=2	or	3
_			

	t	σ_w^2
	t = 0	Invalid
	t = 1	2.50
V	t=2	0.75
V	t = 3	0.75
	t = 4	1.16
	t=5	2.00
	t=6	Invalid
		Nkfustco

- Between-Class Variance $\sigma_b^2(t)$
 - Definition:

$$\sigma_b^2(t) = P_0(t)P_1(t)(\mu_0(t) - \mu_1(t))^2$$

• σ_w^2 -Based Objective Function

$$\sigma_G^2 = \sigma_w^2(t) + \sigma_b^2(t)$$

constant minimize maximize

$$\to t^* = \operatorname{argmax} \sigma_b^2 \quad \text{s.t.} \ P_0(t) \times P_1(t) > 0$$

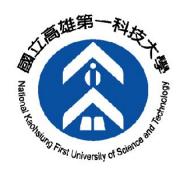

- Initialization
 - initialize four statistical variables

$$(P_0 = 0.0) P_1 = 1.0$$
 $(Q_0 = 0.0) Q_1 = \sum_{i=0}^{L-1} i \times p_i$

• initialize two variables

•
$$t^* = 0$$
: optimal threshold

$$\sigma_{b,max}^2 = 0$$
: maximal between-class variance

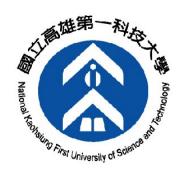

- Iteration (t = 0,1,...,L-1)
 - Step 1: update four statistical variables in a recursive manner

$$P_0 \leftarrow P_0 + p_t \qquad P_1 \leftarrow P_1 - p_t$$

$$Q_0 \leftarrow Q_0 + t \times p_t \qquad Q_1 \leftarrow Q_1 - t \times p_t$$

• Step 2: proceed to the next iteration $t \leftarrow t + 1$ if $P_0 = 0.0$ or $P_1 = 0.0$

- Iteration (t = 0, 1, ..., L 1)
 - Step 3: compute μ_0 and μ_1

$$\mu_0 = \frac{Q_0}{P_0} \qquad \qquad \mu_1 = \frac{Q_1}{P_1}$$

• Step 4: compute between-class variance $\sigma_b^2(t)$

$$\sigma_b^2(t) = P_0 P_1 \times (\mu_0 - \mu_1)^2$$

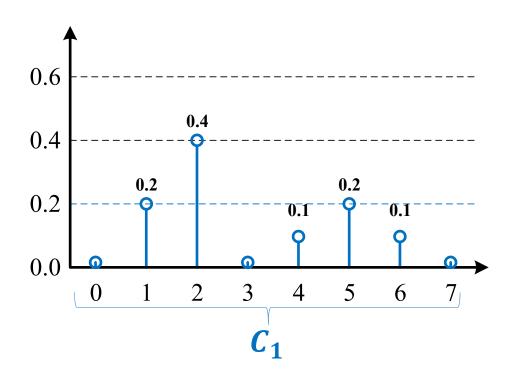

• Step 5: update t^* and $\sigma_{b,max}^2$ if $\sigma_b^2(t) \ge \sigma_{b,max}^2$

$$t^* \leftarrow t$$
 $\sigma_{b,max}^2 \leftarrow \sigma_b^2(t)$

• Example: Initialization Step

$$P_0 = 0.0$$
 $P_1 = 1.0$

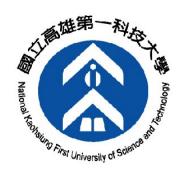

$$Q_0 = 0.0$$

$$Q_1 = 0 \times 0.0 + 1 \times 0.2 + ...$$

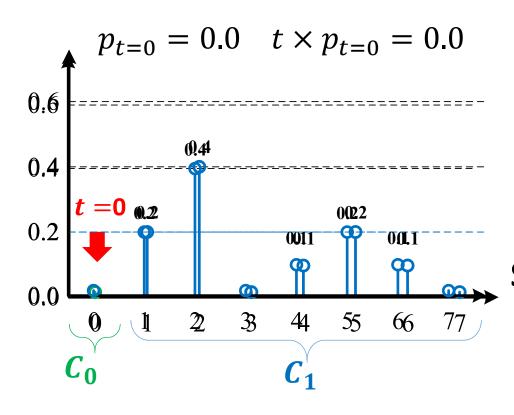

+6 × 0.1 + 7 × 0.0
= 3.0

$$t^* = 0 \qquad \qquad \sigma_{b,max}^2 = 0$$

• Example: (t = 0)

Step 1:

$$P_0 \leftarrow 0.0 + p_t \Rightarrow P_0 = 0.0$$

$$P_1 \leftarrow 1.0 - p_t \Rightarrow P_1 = 1.0$$

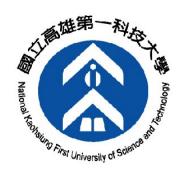

$$Q_0 \leftarrow 0.0 + t \times p_t \Rightarrow Q_0 = 0.0$$

$$Q_1 \leftarrow 3.0 - t \times p_t \Rightarrow Q_1 = 3.0$$

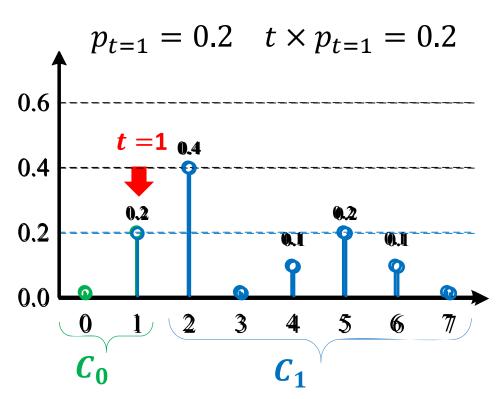

Step 2:

proceed to the next iteration $t \leftarrow t + 1$ because $P_0 = 0.0$

• Example: (t = 1)

Step 1

$$P_0 \leftarrow 0.0 + p_t \Rightarrow P_0 = 0.2$$

$$P_1 \leftarrow 1.0 - p_t \Rightarrow P_1 = 0.8$$

$$Q_0 \leftarrow 0.0 + t \times p_t \Rightarrow Q_0 = 0.2$$

$$Q_1 \leftarrow 3.0 - t \times p_t \Rightarrow Q_1 = 2.8$$

• Example: (t = 1)

$p_{t=1} = 0.2$ $t \times p_{t=1} = 0.2$ $\mu_0 = \frac{0.2}{0.2} = 1.0$ $\mu_1 = \frac{2.8}{0.8} = 3.5$ 0.6 $t = 1_{0.4}$ 0.4 0.2 0.2 0.0

Step 3

$$\mu_0 = \frac{0.2}{0.2} = 1.0$$
 $\mu_1 = \frac{2.8}{0.8} = 3.5$

Step 4

$$\sigma_b^2(t) = 0.2 \times 0.8$$

 $\times (1.0 - 3.5)^2 = 1.0$

Step 5

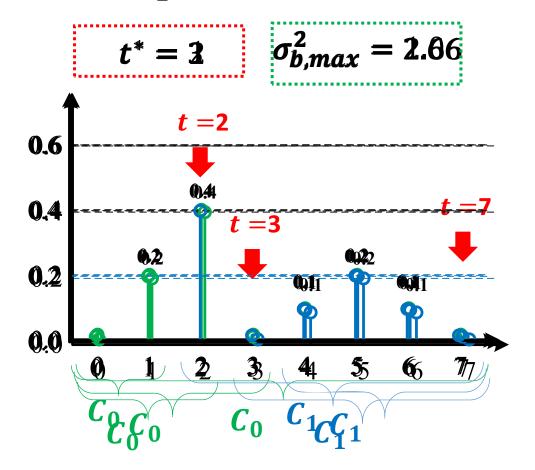

$$t^* \leftarrow 1$$

$$t^* \leftarrow 1$$
 $\sigma_{b,max}^2 \leftarrow 1.0$

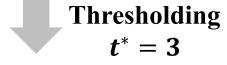

Example

2	2	2	1	4
2	1	6	4	1
2	2	1	6	5
2	2	5	5	5

0	0	0	0	1
0	0	1	1	0
0	0	0	1	1
0	0	1	1	1
